Suspended Ceilings

Ceilings should look good and at the same time they must fulfil the many essential project requirements. Sound control and fire protection should be incorporated in a simple installation.

Our suspended ceilings are used to conceal cabling, piping and ventilation ducts. The structure consists of a grid of metal channels and tee pieces suspended from the overhead structure by hanger wires and/or hanger straps. The grid forms a 600 x 1200mm or 600 x 600mm spread pattern and each opening is then filled with an acoustic ceiling tile. Fluorescent light fittings of the same dimensions can also be installed in areas required.

NetPro's focus is on **quality** and **service**
